begin

Java supports 64, 32, 16, 8 signed ints, plus 1 bit (boolean) ints, and char is 16-bit unsigned. E.g. an 8-bit stamp has a default range of -128..+127. And a 1-bit stamp has a default range of -1..0, surprisingly.

During calculations the smaller sizes are sign-extended to 32 bits.

type-synonym *int64* = 64 word — long

type-synonym *int32* = 32 word — int

type-synonym *int16* = 16 word — short

type-synonym *int8* = 8 word — char

type-synonym *int1* = 1 word — boolean

abbreviation *valid-int-widths* :: nat set **where**

valid-int-widths $\equiv \{1, 8, 16, 32, 64\}$

type-synonym *iwidth* = nat

fun *bit-bounds* :: nat \Rightarrow (int \times int) **where**

bit-bounds bits = (((2 \wedge bits) div 2) * -1, ((2 \wedge bits) div 2) - 1)

definition *logic-negate* :: ('a::len) word \Rightarrow 'a word **where**

logic-negate x = (if x = 0 then 1 else 0)

fun *int-signed-value* :: iwidth \Rightarrow int64 \Rightarrow int **where**

int-signed-value b v = sint (signed-take-bit (b - 1) v)

fun *int-unsigned-value* :: iwidth \Rightarrow int64 \Rightarrow int **where**

int-unsigned-value b v = uint v

A convenience function for directly constructing -1 values of a given bit size.

fun *neg-one* :: iwidth \Rightarrow int64 **where**

neg-one b = mask b

1.1 Bit-Shifting Operators

definition *shiffl* (infix << 75) **where**

$\text{shiffl } w \ n = (\text{push-bit } n) \ w$

lemma *shiffl-power*[simp]: $(x :: ('a :: \text{len}) \text{ word}) * (2^j) = x << j$
unfolding *shiffl-def* **apply** (*induction j*)
apply *simp* **unfolding** *funpow-Suc-right*

lemma $(x :: ('a :: \text{len}) \text{ word}) * ((2^j) + 1) = x << j + x$
by (*simp add: distrib-left*)

lemma $(x :: ('a :: \text{len}) \text{ word}) * ((2^j) - 1) = x << j - x$
by (*simp add: right-diff-distrib*)

lemma $(x :: ('a :: \text{len}) \text{ word}) * ((2^j) + (2^k)) = x << j + x << k$
by (*simp add: distrib-left*)

lemma $(x :: ('a :: \text{len}) \text{ word}) * ((2^j) - (2^k)) = x << j - x << k$
by (*simp add: right-diff-distrib*)

Unsigned shift right.

definition *shiftr* (**infix** $>>> 75$) **where**
 $\text{shiftr } w \ n = (\text{drop-bit } n) \ w$

corollary $(255 :: 8 \text{ word}) >>> (2 :: \text{nat}) = 63$ **by** *code-simp*

Signed shift right.

definition *sshiftr* :: $'a :: \text{len} \text{ word} \Rightarrow \text{nat} \Rightarrow 'a :: \text{len} \text{ word}$ (**infix** $>> 75$) **where**
 $\text{sshiftr } w \ n = \text{word-of-int } ((\text{sint } w) \text{ div } (2^n))$

corollary $(128 :: 8 \text{ word}) >> 2 = 0xE0$ **by** *code-simp*

1.2 Fixed-width Word Theories

1.2.1 Support Lemmas for Upper/Lower Bounds

lemma *size32*: $\text{size } v = 32$ **for** $v :: 32 \text{ word}$
using *size-word.rep-eq*
using *One-nat-def add.right-neutral add-Suc-right len-of-numeral-defs(2) len-of-numeral-defs(3)*
mult.right-neutral mult-Suc-right numeral-2-eq-2 numeral-Bit0
by (*smt (verit, del-insts) mult commute*)

lemma *size64*: $\text{size } v = 64$ **for** $v :: 64 \text{ word}$
using *size-word.rep-eq*
using *One-nat-def add.right-neutral add-Suc-right len-of-numeral-defs(2) len-of-numeral-defs(3)*
mult.right-neutral mult-Suc-right numeral-2-eq-2 numeral-Bit0
by (*smt (verit, del-insts) mult commute*)

lemma *lower-bounds-equiv*:
assumes $0 < N$
shows $\neg(((2::int) \wedge (N-1))) = (2::int) \wedge N \text{ div } 2 * -1$
by (*simp add: assms int-power-div-base*)

lemma *upper-bounds-equiv*:
assumes $0 < N$
shows $(2::int) \wedge (N-1) = (2::int) \wedge N \text{ div } 2$
by (*simp add: assms int-power-div-base*)

Some min/max bounds for 64-bit words

lemma *bit-bounds-min64*: $((fst (bit-bounds 64))) \leq (sint (v::int64))$
unfolding *bit-bounds.simps fst-def*
using *sint-ge[of v]* **by** *simp*

lemma *bit-bounds-max64*: $((snd (bit-bounds 64))) \geq (sint (v::int64))$
unfolding *bit-bounds.simps fst-def*
using *sint-lt[of v]* **by** *simp*

Extend these min/max bounds to extracting smaller signed words using *signed_take_bit*.

Note: we could use *signed* to convert between bit-widths, instead of *signed_take_bit*.
But that would have to be done separately for each bit-width type.

corollary *sint(signed_take_bit 7 (128 :: int8)) = -128* **by** *code-simp*

ML-val $\langle @\{thm\ signed_take_bit_decr_length_iff\} \rangle$
declare $[[show_types=true]]$
ML-val $\langle @\{thm\ signed_take_bit_int_less_exp\} \rangle$

lemma *signed_take_bit_int_less_exp_word*:

3 Operator Semantics

```

theory Values
  imports
    JavaWords
begin

```

In order to properly implement the IR semantics we first introduce a type that represents runtime values. These runtime values represent the full range of primitive types currently allowed by our semantics, ranging from basic integer types to object references and arrays.

Note that Java supports 64, 32, 16, 8 signed ints, plus 1 bit (boolean) ints, and char is 16-bit unsigned. E.g. an 8-bit stamp has a default range of -128..+127. And a 1-bit stamp has a default range of -1..0, surprisingly.

During calculations the smaller sizes are sign-extended to 32 bits, but explicit widening nodes will do that, so most binary calculations should see equal input sizes.

An object reference is an option type where the *None* object reference points to the static fields. This is examined more closely in our definition of the heap.

```

type-synonym objref = nat option

```

```

datatype (discs-sels) Value =
  UndefVal |

```

```

IntVal iwidth int64 |

```

ObjRef objref |
ObjStr string

3.1 Arithmetic Operators

We need to introduce arithmetic operations which agree with the JVM.

Within the JVM, bytecode arithmetic operations are performed on 32 or 64 bit integers, unboxing where appropriate.

The following collection of *intval* functions correspond to the JVM arithmetic operations. We merge the 32 and 64 bit operations into a single function, even though the stamp of each *IRNode* tells us exactly what the bit widths will be. These merged functions make it easier to do the instantiation of *Value* as 'plus', etc. It might be worse for reasoning, because it could cause more case analysis, but this does not seem to be a problem in practice.

```
fun intval-add :: Value  $\Rightarrow$  Value  $\Rightarrow$  Value where  
  intval-add (IntVal b1 v1) (IntVal b2 v2) =

```

```

fun intval-conditional :: Value ⇒ Value ⇒ Value ⇒ Value where
  intval-conditional cond tv fv = (if (val-to-bool cond) then tv else fv)

```

3.4 Narrowing and Widening Operators

Note: we allow these operators to have $\text{inBits}=\text{outBits}$, because the Graal compiler also seems to allow that case, even though it should rarely / never arise in practice.

Some sanity checks that $\text{take_bit } N$ and $\text{signed_take_bit}(N-1)$ match up as expected.

```

corollary sint (signed-take-bit 0 (1 :: int32)) = -1 by code-simp
corollary sint (signed-take-bit 7 ((256 + 128) :: int64)) = -128 by code-simp
corollary sint (take-bit 7 ((256 + 128 + 64) :: int64)) = 64 by code-simp
corollary sint (take-bit 8 ((256 + 128 + 64) :: int64)) = 128 + 64 by code-simp

```

```

fun intval-narrow :: nat  $\Rightarrow$  nat  $\Rightarrow$  Value  $\Rightarrow$  Value where
  intval-narrow inBits outBits (IntVal b v) =
    (if inBits = b  $\wedge$  0 < outBits  $\wedge$  outBits  $\leq$  inBits  $\wedge$  inBits  $\leq$  64
     then new-int outBits v
     else UndefVal) |
  intval-narrow - - - = UndefVal

```

```

fun intval-sign-extend :: nat  $\Rightarrow$  nat  $\Rightarrow$  Value  $\Rightarrow$  Value where
  intval-sign-extend inBits outBits (IntVal b v) =
    (if inBits = b  $\wedge$  0 < inBits  $\wedge$  inBits  $\leq$  outBits  $\wedge$  outBits  $\leq$  64
     then new-int outBits (signed-take-bit (inBits - 1) v)
     else UndefVal) |
  intval-sign-extend - - - = UndefVal

```

```

fun intval-zero-extend :: nat  $\Rightarrow$  nat  $\Rightarrow$  Value  $\Rightarrow$  Value where
  intval-zero-extend inBits outBits (IntVal b v) =
    (if inBits = b  $\wedge$  0 < inBits  $\wedge$  inBits  $\leq$  outBits  $\wedge$  outBits  $\leq$  64
     then new-int outBits (take-bit inBits v)
     else UndefVal) |
  intval-zero-extend - - - = UndefVal

```

Some well-formedness results to help reasoning about narrowing and widening operators

lemma *intval-narrow-ok*:

```

assumes intval-narrow inBits outBits val  $\neq$  UndefVal
shows 0 < outBits  $\wedge$  outBits  $\leq$  inBits  $\wedge$  inBits  $\leq$  64  $\wedge$  outBits  $\leq$  64  $\wedge$ 
  is-IntVal val  $\wedge$ 
  intval-bits val = inBits
using assms intval-narrow.simps neq0-conv intval-bits.simps
by (metis Value.disc(2) intval-narrow.elims le-trans)

```

lemma *intval-sign-extend-ok*:

```

assumes intval-sign-extend inBits outBits val  $\neq$  UndefVal
shows 0 < inBits  $\wedge$ 

```

```

    inBits ≤ outBits ∧ outBits ≤ 64 ∧
    is-IntVal val ∧
    intval-bits val = inBits
using assms intval-sign-extend.simps neq0-conv
by (metis intval-bits.simps intval-sign-extend.elims is-IntVal-def)

```

```

lemma intval-zero-extend-ok:
assumes intval-zero-extend inBits outBits val ≠ UndefVal
shows 0 < inBits ∧
    inBits ≤ outBits ∧ outBits ≤ 64 ∧
    is-IntVal val ∧
    intval-bits val = inBits
using assms intval-sign-extend.simps neq0-conv
by (metis intval-bits.simps intval-zero-extend.elims is-IntVal-def)

```

3.5 Bit-Shifting Operators

Note that Java shift operators use unary numeric promotion, unlike other binary operators, which use binary numeric promotion (see the Java language reference manual). This means that the left-hand input determines the output size, while the right-hand input can be any size.

```

fun shift-amount :: iwidth ⇒ int64 ⇒ nat where
    shift-amount b val = unat (and val (if b = 64 then 0x3F else 0x1f))

```

```

fun intval-left-shift :: Value ⇒ Value ⇒ Value where
    intval-left-shift (IntVal b1 v1) (IntVal b2 v2) = new-int b1 (v1 << shift-amount
    b1 v2) |
    intval-left-shift - - = UndefVal

```

Signed shift is more complex, because we sometimes have to insert 1 bits at the correct point, which is at b1 bits.

```

fun intval-right-shift :: Value ⇒ Value ⇒ Value where
    intval-right-shift (IntVal b1 v1) (IntVal b2 v2) =
    (let shift = shift-amount b1 v2 in
    let ones = and (mask b1) (not (mask (b1 - shift) :: int64)) in
    (if int-signed-value b1 v1 < 0
    then new-int b1 (or ones (v1 >>> shift))
    else new-int b1 (v1 >>> shift))) |
    intval-right-shift - - = UndefVal

```

```

fun intval-uright-shift :: Value ⇒ Value ⇒ Value where
    intval-uright-shift (IntVal b1 v1) (IntVal b2 v2) = new-int b1 (v1 >>> shift-amount
    b1 v2) |
    intval-uright-shift - - = UndefVal

```

4 Stamp Typing

```

theory Stamp
  imports Values
begin

```

The GraalVM compiler uses the Stamp class to store range and type information for a given node in the IR graph. We model the Stamp class as a datatype, Stamp, and provide a number of functions on the datatype which correspond to the class methods within the compiler.

Stamp information is used in a variety of ways in optimizations, and so, we additionally provide a number of lemmas which help to prove future optimizations.

```

datatype Stamp =
  VoidStamp
| IntegerStamp (stp-bits: nat) (stpi-lower: int) (stpi-upper: int)

| KlassPointerStamp (stp-nonNull: bool) (stp-alwaysNull: bool)
| MethodCountersPointerStamp (stp-nonNull: bool) (stp-alwaysNull: bool)
| MethodPointersStamp (stp-nonNull: bool) (stp-alwaysNull: bool)
| ObjectStamp (stp-type: string) (stp-exactType: bool) (stp-nonNull: bool) (stp-alwaysNull:
bool)
| RawPointerStamp (stp-nonNull: bool) (stp-alwaysNull: bool)
| IllegalStamp

```

```

fun is-stamp-empty :: Stamp ⇒ bool where
  is-stamp-empty (IntegerStamp b lower upper) = (upper < lower) |

  is-stamp-empty x = False

```

Just like the IntegerStamp class, we need to know that our lo/hi bounds fit into the given number of bits (either signed or unsigned). Our integer stamps have infinite lo/hi bounds, so if the lower bound is non-negative, we can assume that all values are positive, and the integer bits of a related value

can be interpreted as unsigned. This is similar (but slightly more general) to what IntegerStamp.java does with its test: if (sameSignBounds()) in the unsignedUpperBound() method.

Note that this is a bit different and more accurate than what StampFactory.forUnsignedInteger does (it widens large unsigned ranges to the max signed range to allow all bit patterns) because its lo/hi values are only 64-bit.

```
fun valid-stamp :: Stamp ⇒ bool where
  valid-stamp (IntegerStamp bits lo hi) =
    (0 < bits ∧ bits ≤ 64 ∧
     fst (bit-bounds bits) ≤ lo ∧ lo ≤ snd (bit-bounds bits) ∧
     fst (bit-bounds bits) ≤ hi ∧ hi ≤ snd (bit-bounds bits)) |
  valid-stamp s = True
```

```
experiment begin

5 Graph Representation

5.1 IR Graph Nodes

theory *IRNodes*

imports

Values

begin

The GraalVM IR is represented using a graph data structure. Here we define the nodes that are contained within the graph. Each node represents a Node subclass in the GraalVM compiler, the node classes have annotated fields to indicate input and successor edges.

We represent these classes with each *IRNode* constructor explicitly labelling a reference to the node IDs that it stores as inputs and successors.

The *inputs_of* and *successors_of* functions partition those labelled references into input edges and successor edges of a node.

To identify each Node, we use a simple natural number index. Zero is always the start node in a graph. For human readability, within nodes we write INPUT (or special case thereof) instead of ID for input edges, and SUCC instead of ID for control-flow successor edges. Optional edges are handled as "INPUT option" etc.

```

5.2 IR Graph Node Hierarchy

```

theory IRNodeHierarchy
imports IRNodes
begin

```

It is helpful to introduce a node hierarchy into our formalization. Often the GraalVM compiler relies on explicit type checks to determine which operations to perform on a given node, we try to mimic the same functionality by using a suite of predicate functions over the IRNode class to determine inheritance.

As one would expect, the function `is<ClassName>Type` will be true if the node parameter is a subclass of the `ClassName` within the GraalVM compiler.

These functions have been automatically generated from the compiler.

5.3 IR Graph Type

```

theory IRGraph
  imports
    IRNodeHierarchy
    Stamp
    HOL-Library.FSet
    HOL.Relation
begin

```

This theory defines the main Graal data structure - an entire IR Graph.

IRGraph is defined as a partial map with a finite domain. The finite domain is required to be able to generate code and produce an interpreter.

```

typedef IRGraph = {g :: ID ⇒ (IRNode × Stamp) . finite (dom g)}
proof -
  have finite(dom(Map.empty)) ∧ ran Map.empty = {} by auto
  then show ?thesis
    by fastforce
qed

```

5.4 Structural Graph Comparison

theory

Comparison

imports

IRGraph

begin

We introduce a form of structural graph comparison that is able to assert structural equivalence of graphs which differ in zero or more reference node chains for any given nodes.

fun *find-ref-nodes* :: *IRGraph* \Rightarrow (*ID* \rightarrow *ID*) **where**
find-ref-nodes *g* = *map-of*
 (*map* ($\lambda n. (n, \text{ir-ref } (\text{kind } g \ n)))$) (*filter* ($\lambda id. \text{is-RefNode } (\text{kind } g \ id)$) (*sorted-list-of-set*
 (*ids* *g*))))

fun *replace-ref-nodes* :: *IRGraph* \Rightarrow (*ID* \rightarrow *ID*) \Rightarrow *ID list* \Rightarrow *ID list* **where**
replace-ref-nodes *g m xs* = *map* ($\lambda id. (\text{case } (m \ id) \text{ of } \text{Some } other \Rightarrow other \mid \text{None}$
 $\Rightarrow id)$) *xs*

fun *find-next* :: *ID list* \Rightarrow *ID set* \Rightarrow *ID option* **where**
find-next *to-see seen* = (*let* *l* = (*filter* ($\lambda nid. nid \notin seen$) *to-see*)
in (*case* *l* of [] \Rightarrow *None* | *xs* \Rightarrow *Some* (*hd* *xs*)))

g1 *g2*}

```

fun eqGraph :: IRGraph ⇒ IRGraph ⇒ bool (infix ≈s 20)
  where
    eqGraph isabelle-graph graal-graph = ((diffNodesGraph isabelle-graph graal-graph)
    = {})

end

```

5.5 Control-flow Graph Traversal

```

theory
  Traversal
imports
  IRGraph
begin

```

```

type-synonym Seen = ID set

```

nextEdge helps determine which node to traverse next by returning the first successor edge that isn't in the set of already visited nodes. If there is not an appropriate successor, None is returned instead.

```

fun nextEdge :: Seen ⇒ ID ⇒ IRGraph ⇒ ID option where
  nextEdge seen nid g =
    (let nids = (filter (λnid'. nid' ∉ seen) (successors-of (kind g nid))) in
    (if length nids > 0 then Some (hd nids) else None))

```

pred determines which node, if any, acts as the predecessor of another.

Merge nodes represent a special case where-in the predecessor exists as an input edge of the merge node, to simplify the traversal we treat only the first input end node as the predecessor, ignoring that multiple nodes may act as a successor.

For all other nodes, the predecessor is the first element of the predecessors set. Note that in a well-formed graph there should only be one element in the predecessor set.

```

fun pred :: IRGraph ⇒ ID ⇒ ID option where
  pred g nid = (case kind g nid of
    (MergeNode ends -) ⇒ Some (hd ends) |
    - ⇒
      (if IRGraph.predecessors g nid = {}
      then None else
      Some (hd (sorted-list-of-set (IRGraph.predecessors g nid))))
  )

```

Here we try to implement a generic fork of the control-flow traversal algorithm that was initially implemented for the ConditionalElimination phase

type-synonym 'a TraversalState = (ID × Seen × 'a)

inductive Step

∷ ('a TraversalState ⇒ 'a) ⇒ IRGraph ⇒ 'a TraversalState ⇒ 'a TraversalState
option ⇒ bool

for sa g **where**

— Hit a BeginNode with an IfNode predecessor which represents the start of a basic block for the IfNode. 1. nid' will be the successor of the begin node. 2. Find the first and only predecessor. 3. Extract condition from the preceding IfNode. 4. Negate condition if the begin node is second branch (we've taken the else branch of the condition) 5. Add the condition or the negated condition to stack 6. Perform any stamp updates based on the condition using the registerNewCondition function and place them on the top of the stack of stamp information

[[kind g nid = BeginNode nid';

nid ∉ seen;
seen' = {nid} ∪ seen;

Some ifcond = pred g nid;
kind g ifcond = IfNode cond t f;

analysis' = sa (nid, seen, analysis)]
⇒ Step sa g (nid, seen, analysis) (Some (nid', seen', analysis')) |

— Hit an EndNode 1. nid' will be the usage of EndNode 2. pop the conditions and stamp stack

[[kind g nid = EndNode;

nid ∉ seen;
seen' = {nid} ∪ seen;

nid' = any-usage g nid;
